

What is claimed is:

1. An auto settlement system using a locker comprising:
 - reader means for reading a trader identifier decided beforehand by a contract concluded between a proprietary company of lockers and a trader;
 - operation keys for inputting a recipient identifier;
 - a sensor for detecting whether or not there is an article in a box of said locker;
 - an electric lock for locking a door of said box when said sensor detects said article; and
 - a central control unit for storing data including said recipient identifier, a trader's name or the like to transmit said data to the control center.
2. An auto settlement system using a locker according to claim 1, wherein said article data thereof being input by said operation keys is priced higher than a preset amount such that each box of the locker rejects to accept said article therewithin.
3. An auto settlement system using a locker, wherein when said article deposited in the locker is to be taken out with a purchase money thereof being unsettled, a recipient identifier decided beforehand under a contract with a proprietary company of said locker is read by reader means installed in said locker, or a password given by said proprietary company is
